

Entro 3 Harness

The Entro 3 full body harness has been designed for industrial rope access and technical rescue, where personnel wish to have either a wrap around or step in fit, with a pull over the head style. The innovative wrap around pattern includes two independent front waist attachment points in different profiles. This is so rope access and rescue technicians can utilise any type of rope descender without twisting the system.

The Entro 3 full body harness is also fitted with upper 'D' connection points, at the front and rear for safety back-up and fall arrest attachment. The padded yolk gives additional comfort and provides for routing of breathing air hoses easily. Conforms to EN813:2008 EN358:1999, and EN361:2002.

Designed to be fully compatible with the Hornet life support helmets and Airstar breathing apparatus. This harness allows for comfortable work in suspension inside reactors integrating respiratory protection and fall and access protection, and rationalising on equipment.
